                                                                                                                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an ancestral or center of tree (COT) viral nucleic acid and amino acid sequences that are determined founder acquences of a highly diverse viral strain. The invention also relates to a composition comprising a highly diverse viral ancestor protein or an immunogenic fragment of an ancestor or COT protein for inducing an immune response in a mammal and a method for preparing an ancestral or COT viral amino acid sequence. The composition and methods are useful for diagnosing, preventing or treating viral (e.g. HIV) infection. The invention is also useful in gene therapy. The present sequence is the Human immunodeficiency virus 1 (HIV-1), subtype B, env ancestral protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated ancestral or COT viral nucleic acid and amino acid sequences that are determined founder sequences of a highly diverse viral strain, useful for diagnosing, preventing or treating viral (e.g. HIV) infection.

The invention describes an isolated protein (I) selected from 106 fully defined 500-866 amino acid sequences given in the specification. Also described are: a nucleic acid comprising: a nucleotide sequence encoding COMG HIV gp160 protein, subtype C ancestral HIV envelope protein, subtype C consensus HIV envelope protein, subtype C consensus HIV net protein, Group M consensus HIV envelope protein, subtype A consensus HIV pol protein, Group M consensus HIV of protein, subtype A consensus HIV pol protein, Group M consensus HIV of protein, subtype C consensus HIV pol protein, subtype B consensus HIV gag protein, or subtype B consensus HIV pol protein, subtype B consensus HIV gag protein, or subtype C consensus HIV pol protein, subtype B consensus HIV gag protein, or subtype B consensus HIV pol protein, subtype B consensus HIV gag protein, or subtype B consensus HIV gag protein, a vector comprising the nucleotide sequence comprising the nucleotide sequence encoding (I); or a nucleotide sequence specification; a vector comprising the nucleic acid of (I); a composition comprising at least one protein or nucleic acid above and a carrier; and consensus in mammal. The protein is a consensus or consensus or ancestral immunogen useful for inducing antinuose a T cell response. This is the amino acid sequence of HIV subtype B consensus env protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NAWKNNAVEQMHEDIISLMDQSLKPCVKLTPLCVTLNCTDLNTNNTTNTTELSIIVVWEQ 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an ancestral or center of tree (COT) viral nucleic acid and amino acid sequences that are determined founder sequences of a highly diverse viral strain. The invention also relates to a composition comprising a highly diverse viral ancestor protein or an immunogenic fragment of an ancestor or COT protein for inducing an immune response in a mammal and a method for preparing an ancestral or COT viral diagnosing, preventing or treating viral (e.g. HIV) infection. The diagnosing is also useful in gene therapy. The present sequence is a clade B env (gp160) protein. This sequence is used in the comparison of the most recent common ancestor (MRCA), COT least squares (LSCOt) and COT minimum of means (MMCC) reconstructions for the clade B env gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FINAWKONNYVEQWHEDIISLWDQSLKPCVXLTPLCVTLACTDLATINTTRTTTLSIIVVWE 121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated ancestral or COT viral nucleic acid and amino acid sequences that are determined founder sequences of a highly diverse viral strain, useful for diagnosing, preventing or treating viral (e.g. HIV) infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             91

virus (rWWA). Specifically, it refers to the use of rWA vectors in the development of vaccines to protect against cancer or infectious viral diseases such as HIV, hepatitis and smalpox. The present invention of searches introducing a neutral multiple describes introducing a neutral multiple describes introducing a neutral multiple describes introducing a necessary for replication of the rWVA, in particular an exemplary gene is the vaccinia uracil DNA givosylase gene. Additional vaccinia genes that can contain null mutations include, but are not limited to, ILI beta receptor, A46R, IL-18BP, A41L and B31.

Accordingly, it provides a system for producing an appropriate vaccine that involves an immortalized, non-transformed avian fibroblast cell infected with the rMVA, where the cell is from a complementing cell line that include an interpretation of that the virus is able to propagate. Purthermore, the rMVA may include a heterologous nucleic acid sequence encoding an antigen or a fragment thereof derived from viral, animal or plant polynucleotides, for example this may include an antigen from the HIV virus, massales virus, sand mutagen from the river blindness nematode.

The rMVA also comprises a second heterologous nucleic acid sequence or an antigen or a mutagen from the river blindness nematode.

The rMVA also comprises a second heterologous nucleic acid sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               92
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in a host and exhibits antimicrobial, virucide, anti-HIV, cytostatic, antiinflammatory and hepatocropic activities. This polypeptide sequence is a human codon-optimized HIV-1 consensus protein sequence, encoded by an antigenic sequence of an MVA-based vector given in an exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           linked to an early stage viral promoter. As such, the developed vaccine can be administered in a sufficient amount to effect an immune response

This invention telates to a mover accomplaint modulities vaccinia Antwara virus (TWMA). Specifically, it refers to the use of rWMA vectors in the development of vaccines to protect against cancer or infectious viral development of vaccines to protect against cancer or infectious viral development as HIV, hepatitis and smallpox. The present invention describes introducing a mull mutation (preferably a deletion) into a vaccinia gene that is necessary for replication of the rWWA, in the constitution of the rWWA, in the constitution of the rWMA, in the constitution of the rWMA, in the constitution of the rWMA, in the constitution of the rWMA in the result of the rWMA where the contain null mutations include, but are not limited to, Ill beta receptor, A46R, IL-18BP, A41L and E31.

Accordingly, it provides a system for producing an appropriate vaccine that involves an immortalized, non-transformed avian fibroblast cell infected with the rWWA, where the cell is from a complementing cell line that involves an immortalized, non-transformed avian fibroblast cell include a heterologous nucleic acid sequence encoding an antigen or a fragment thereof derived from viral, animal or plant polynuclectides, can mutate or the river blindness nematode. SARS virus, influence a second heterologous nucleic acid sequence can example this may include an antigen from the HIV virus, measles virus, sample this may include an antigen from the HIV virus, measles virus, can antigen from the river blindness nematode. The rMWA also comprises a second heterologous nucleic acid sequence encoding a pro-apoptotic, anti-apoptotic or an immunomodulator operably linked to an early stage viral promoter. As such, the developed vaccine

can be administered in a sufficient amount to effect an immune response in a host and exhibits antimicrobial, virucide, anti-HIV, cytostatic, antiflammatory and hepatotropic activities. This polypeptide sequence is a human codon-optimized HIV-1 consensus fusion protein sequence, encoded by an antigenic sequence of an MVA-based vector given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gag; pol; env; nef; fusion protein; viral replication; recombinant DNA; vector; vaccine; cancer; infections disease; HIV; hepatitis; variola virus infection; immune stimulation; antimicrobial; virucide; anti-HIV; cytostatic; antiniflammatory; hepatotropic; immunogenicity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention teraces to a mover recommunate mountains another virus (rWMA). Specifically, it refers to the use of rWMA vectors in the development of vaccines to protect against cancer or infectious viral deseases such as HIV, hepatitis and smallpox. The present invention describes introducing a null mutation (prefrably a deletion) into a vaccinia gene that is necessary for replication of the rWMA, in the particular an exemplary gene is the vaccinia uracil DNA glycosylase gene. Additional vaccinia genes that can contain null mutations include, but are not limited to, ILI beta receptor, A46K, IL-18BP, A41L and B31.

Accordingly, it provides a system for producing an appropriate vaccine that involves an immortalized, non-transformed avian fibroblast cell infected with the rWMA, where the cell is from a complementing cell line that the virus is able to propagate. Furthermore, the rMM may cinclude a heterologous nucleic acid sequence encoding an antigen or a fragment thereof derived from viral, animal or plant polynucleotides, for example this may include an antigen from the HIV virus, measles virus, SARS virus, influenza virus, malaria plasmodium, tuberculosis Bacillus, yellow fever virus, dengue flavivirus or the river blindness menatode.

The rMMA also comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1626
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1680

The invention describes an isolated protein (I) selected from 106 fully defined 500-866 amino acid sequences given in the specification. Also described are: a nucleic acid comprising: a nucleotide sequence encoding CONG HIV gp160 protein, subtype C ancestral HIV envelope protein, subtype C consensus HIV envelope protein, subtype C consensus HIV nef protein, Group M consensus HIV envelope protein, subtype A consensus HIV envelope protein, Group M consensus HIV or gag protein, subtype C consensus HIV pol protein, Group M consensus HIV or gag protein, or subtype C consensus HIV pol protein, subtype B consensus HIV envelope protein, where the conclectide sequence comprises codons optimized for expression in human cells; a nucleotide sequence encoding (I); or a nucleotide sequence comprising the nucleotide sequence encoding (I); or a nucleotide sequence comprising the nucleotide sequence comprising the nucleic acid above and a carrier; and inducing at least one protein or nucleic acid above and a carrier; and inducing an immune response in a mammal. The protein is a consensus or ancestral immunogen useful for inducing antiduces at cell response. This is the amino acid sequence of a HIV (CON-B) consensus gp140 env
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              602

The invention describes an isolated protein (I) selected from 106 fully defined 500-866 amino acid sequences given in the specification. Also described are: a nucleic acid comprising: a nucleotide sequence encoding COM6 HIV gpl60 protein, subtype C ancestral HIV envelope protein, subtype C consensus HIV net protein, group M consensus HIV envelope protein, subtype C consensus HIV envelope protein, group M consensus HIV gag protein, subtype A consensus HIV pol protein, group M consensus HIV gag protein, subtype B consensus HIV pol protein, subtype B consensus HIV pol protein, subtype B consensus HIV pol protein, subtype B consensus HIV gag protein, subtype B consensus HIV envelope protein, where the nucleotide sequence comprises codons optimized for expression in human cells; a nucleotide sequence encoding (I); or a nucleotide sequence comprising the nucleic acid above and a carrier; and inducing an immune response in a mammal. The protein is a consensus or ancestral immunogen useful for inducing antihucing an immune seponse in a mammal. The protein is a consensus or ancestral immunogen useful for inducing antihodies that neutralize a wide spectrum of HIV primary isolates and/or that induces a T cell response. This is the amino acid sequence of HIV (CON-B) envy protein.
                                                                                                                                                anti-HIV; Immunostimulant; immune stimulation; HIV infection; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated consensus or ancestral immunogenic proteins, useful for inducing antibodies that neutralize a wide spectrum of human immunodeficiency virus (HIV) primary isolates and/or that induces a T
